Content

- ☐ Concept
 - ☐ Types of usability tests
 - ☐ Test environments
 - ☐ Typical test plan format
 - ☐ Task selection for evaluation
 - ☐ Measurements and Questionnaires
 - ☐ Summarizing performance results
 - ☐ Analyzing Data
-

Usability Testing

- ❑ Process that employs representative target population participants to evaluate product usability using specific usability criteria
- ❑ Usability testing is not a guarantee for product success, but it should identify at least the key problems

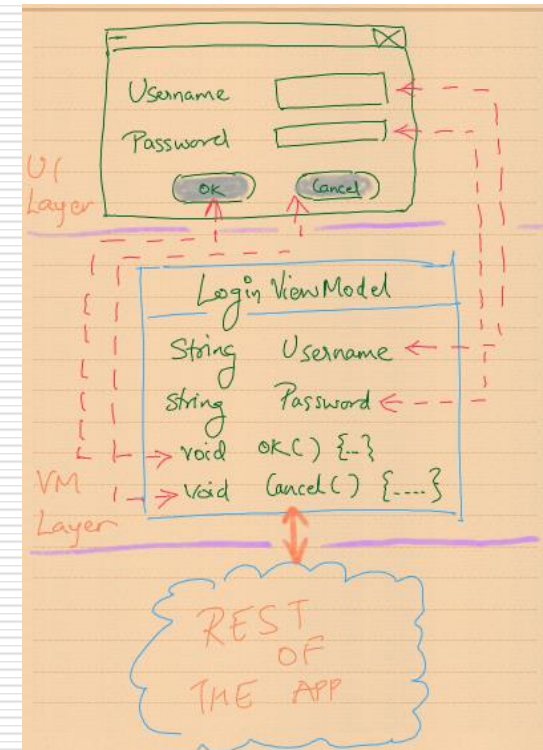

Basic components

1. Development of specific problems statements and test plans and objectives
 2. Use of **representative sample** of end users
 3. Representation of the **actual work environment**
 4. **Observation of end users during** product use or review
 5. Collection of **quantitative and qualitative** measurements
 6. **Analysis of results** and **recommendations**
-

Types of usability tests

Exploratory:

- ❑ Early in the process
- ❑ Can be based on any form of the GUI (sketch, wire diagrams etc.)
- ❑ Evaluate preliminary, basic design concept
- ❑ Perform representative tasks in a "shallow" mode
- ❑ Informal test methodology, a lot of interaction
- ❑ Discuss high level concepts

Types of usability tests

Assessment

- ❑ Done After fundamental concepts are done
- ❑ Evaluates usability of lower level operations
- ❑ The users actually perform set of well defined tasks
- ❑ Less interaction with test monitor
- ❑ Quantitative measurements are collected

Usability Testing

UX METHODS TRADING CARDS

16

Types of usability tests

Validation

- ❑ Done late in development cycle, close to release
 - ❑ Goal is to certify product usability, “disaster insurance” against launching a poor product
 - ❑ Often the first time when the whole product is tested (including help and docs)
 - ❑ Evaluate wrt. some predetermined usability standard or benchmark
 - ❑ Standards come from **previous testing, competitive information, marketing** etc.
 - ❑ Very specific quantitative tests
 - ❑ Can establish standards for future products
 - ❑ Can be also done by beta customers
-

Types of usability tests

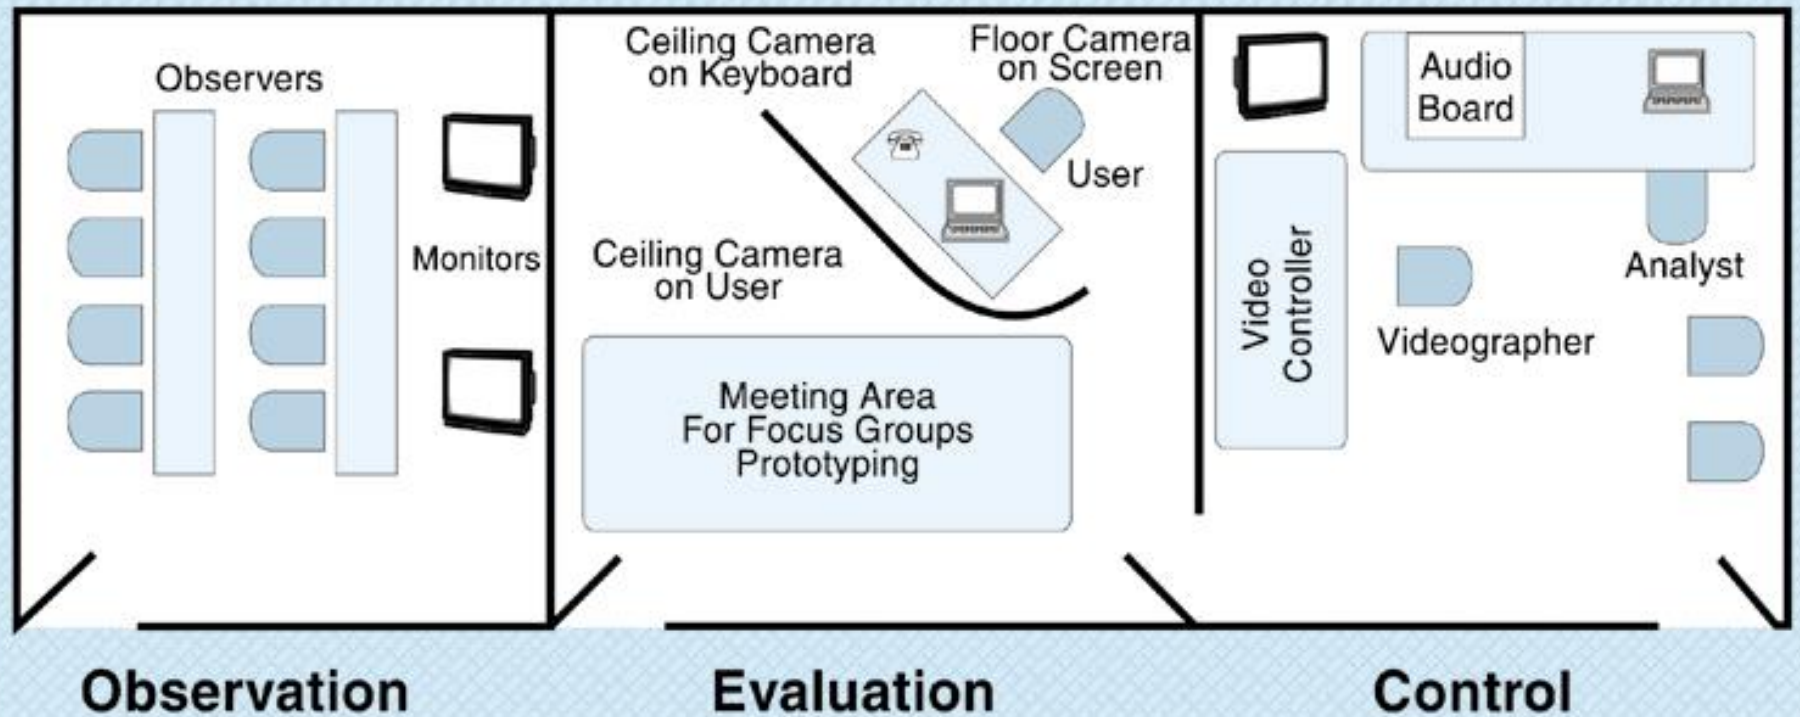

Comparison

- ❑ Can be done at any point in the development cycle
 - ❑ Compare alternatives using objective measures
 - ❑ Can be informal or formal, depending when it is done
 - ❑ Often, best of alternative designs is combined
-

Test environments

- ❑ Simple single room setups
 - Observer/monitor close to evacuator
 - Observer removed from evaluator
 - ❑ Electronic observation room
 - ❑ Classic elaborate usability lab
 - ❑ Mobile lab
-

Example

Typical test plan format

- ❑ Purpose: what is the main purpose of the test
 - ❑ Problem statement: specific questions you want resolved
 - ❑ Test plan and objectives: tasks the user will do
 - ❑ User profile: who will be the users
 - ❑ Method and test design: how will you observe it, how will you collect the data etc.
 - ❑ Test environment and equipment
 - ❑ Test monitor role
 - ❑ Evaluation measures and data to be collected: how will you collect the feedback and how will you evaluate it
 - ❑ Report: what will final report contain
-

Task selection for evaluation

- ❑ Tasks to be evaluated are functions users want to do with the product. **Focus is on user view of the tasks and NOT at the components and details** that you used to implement it. Examples:
 - Create and file document
 - Import several images
 - Find the right document
 - ❑ Objective is to indirectly expose usability flaws by asking the user to perform typical tasks and **NOT telling them exactly how to do it.**
 - ❑ Choose **key and most frequently** done tasks
 - ❑ The **task has to be specific and measurable** (quantitatively or qualitatively)
-

Task components

TASK	DESCRIPTION
Task	Load paper into copier
Machine state	Paper tray empty
Successful completion criteria	Paper properly loaded
Benchmark	Completed in 1 minute

Selection of evaluators and test groups

- ❑ Evaluators should **be representative of the targeted users**
 - ❑ Independent groups or within-subject design (but be careful to avoid exposing users to same tests since this will bias the results)
 - ❑ Adequate numbers of testers
 - ❑ Offer motivation and rewards
-

Measurements and Questionnaires

- Performance data: measures of user behavior such as **error rates, number of accesses to help, time** to perform the task etc.
 - Usually can and should be objectively and automatically measured
 - Preference data: measures of **user opinion, thought process such as rankings, answers to questions, comments etc.**
 - Use questionnaires.
-

Some performance measures (measure what can be measured)

- ☐ Time to complete each task
- ☐ Number and percentage of tasks completed successfully/unsuccessfully
- ☐ Time required to access information
- ☐ Count of incorrect selections
- ☐ Count errors
- ☐ Time for system to respond
- ☐

Data should be collected automatically or manually in an objective way.

Questionnaires (for preference data)

Likert scale

☐ I found GUI easy to use (check one)

___ Strongly disagree ___ Disagree

___ Neither agree or disagree

___ Agree ___ Strongly agree

(can also assign numbers from -2 to 2)

Semantic differentials

☐ I found File Open menu (circle one)

Simple 3 2 1 0 1 2 3 Complex

Questionnaires

Fill in questions

- ☐ I found the following aspects of GUI particularly easy to use (list 0-4 aspects)

Questionnaires

Check-box

- ☐ Please check the statement that best describes your usage of spell check
 - I always use spell check
 - I use spell check only when I have to
 - I never use spell check
-

Questionnaires

Branching questions

- ☐ Would you rather use advanced search
 - NO (skip to question 19)
 - YES (continue)
 - ☐ What kind of advanced search would you like? (check one)
 - Boolean
 - Relevance
-

Summarizing performance results

- Performance data
 - Mean time to complete
 - Median time to complete
 - Range (high and low)
 - Standard deviation (độ lệch) of completion times
 - System response time statistics
 - Task accuracy
 - % of users completing the task within specified time
 - % of users completing the task regardless (không quan tâm) of time
 - Same as above, with assistance
 - Average error rate
-

Summarizing preference results

- For limited choice questions
 - Count how many participants selected each choice (number and %)
 - For Likert scale or semantic differentials provide average scores if there are enough evaluators
 - For free form questions
 - List questions and group answers into categories, also into positive and negative answers
 - For free comments
 - List and group them at the end of the report
-

Analyzing Data

- ❑ Identify and focus on tasks that **did not pass the test** or showed significant problems
 - ❑ Identify **user errors and difficulties**
 - ❑ Identify **sources of errors**
 - ❑ Prioritize problems by criticality = severity AND probability of occurrence
 - ❑ Analyze differences between groups (if applicable)
 - ❑ Provide recommendations at the end
-

Problems statements and performance data to collect

Problem Statement	Performance Data Collected
How effective is the tutorial	Compare error rates of users who used and not used this
How easy is it to perform task X	Error rate OR Number of steps needed

Note: this is Performance data measurement only. You also need to asses user Preference data (see next slide)

Problems statements and preference data to collect

Problem Statement	Preference Data Collected
How effective is the tutorial	Ask user to rate it from very ineffective to very effective (Lickert scale or semantic differentials) + free comments
How easy is it to perform task X	Ask user to rate it from very easy to very difficult (Lickert scale or semantic differentials) + free comments

Relate problem statements with tasks

Problem Statement	Task
How effective is the tutorial	GroupA: Import image w/o using tutorial GroupB: Same but use tutorial first
How easy is it to Create Virtual Machine	Create Virtual machine with "this" properties using New VM Wizard

Task components

TASK	DESCRIPTION
Task	Create VM using New VM Wizard
Machine state	VMware WS SW just loaded
Successful completion criteria	Working VM created
Benchmark	Completed in 30 sec.

Some Suggested GUI issues to cover in preference data collection

Use GUI principles as general measures of quality to evaluate

- ☐ Screen layout matches tasks
- ☐ Amount of information is adequate
- ☐ Good use of text (headlines, help, messages, warnings...)
- ☐ Good use of colors
- ☐ Proper grouping of related info
- ☐ Navigational problems
- ☐ Users get lost in the system
- ☐ Organized by user tasks
- ☐ Icons are self-explanatory
- ☐ Consistency

Note: ask these questions in the context of concrete user tasks not in vacuum

How can we design GUI checklist ?

- ☐ UI elements
 - ☐ User requirements
 - ☐ Standards
 - ☐ Trends

Try It Risk-Free

1-Year Money-Back Guarantee

http://www.clicktale.com/

- ❑ Similar to Userfly, [ClickTale](http://www.clicktale.com/) captures the actions of your website's visitors, including clicks, scrolling, and keystrokes. Other features offered include a scrolling heat map, form analytics, and individual link analysis (e.g. how many clicks or hovers did each link get?).
 - ❑ ClickTale has a free plan that records 400 page views per month for one domain. Some of the features in the free plan are limited; for example, the scrolling heat map is available only for your most popular page.
 - ❑ Paid plans start at \$99 a month, which is still a competitive price for the features that this service offers.

Why Choose CrossBrowserTesting?

2050+ Browser Configurations

Test Chrome, FireFox, Safari, Edge, IE, Windows, OSX, iOS, and more.

100% Real Devices

Test on physical, real devices like the iPhone, Samsung Galaxy, iPad Pro, and more.

Debugging Tools

Native debugging tools like FireBug and Dev tools.

Trust & Security

Enterprise grade security on all of your test data and connections.

Local Testing

Securely test behind your firewall, on a staging server, or locally.

Rest API

Intuitive API lets you test using our entire platform from the command line.

Screenshot Engine

Take automated screenshots across multiple browsers or devices.

Responsive Testing

Quickly test mobile layouts & responsiveness.

Screenshot Comparison

Compare screenshots side-by-side for easy visual regression testing.

The screenshot shows the website of the Faculty of Information Technology (FIT) at Ho Chi Minh City University of Science (HCMUS). The page is titled "KHOA CÔNG NGHỆ THÔNG TIN ĐH. KHOA HỌC TỰ NHIÊN TP.HCM". The navigation bar includes links for "TRANG CHỦ", "TIN TỨC", "GIỚI THIỆU", "NGHIÊN CỨU", and "ĐÀO TẠO". The main content area features a banner for "Tuyển sinh" (Recruitment) and a section titled "GIỚI THIỆU KHOA" (Faculty Introduction). The text describes the faculty's establishment in 1994 and its focus on information technology. The footer includes contact information and a list of links.

This screenshot shows the same website as the previous one, but with a different layout. The navigation bar is more prominent, and the main content area is reorganized. The "Tuyển sinh" banner is still present, but the "GIỚI THIỆU KHOA" section is now more detailed, including a list of links and a description of the faculty's activities. The overall design is more modern and user-friendly.
